Cilasoft Launches Revolutionary Database Auditing Software

Cilasoft Security Solutions today announced the introduction of a revolutionary System i Database Auditing tool that enables security officers and IT auditors to be alerted when a user simply **views** a sensitive database record. In development for over two years, the new software enables customers to meet the rigid PCI requirement to monitor **all** access to sensitive credit card information. Prior to the introduction of this software, database record access audit-ability was limited to reporting add/change and delete events. Never before could a customer audit and report on the "View Record" database event on the System i in an integrated commercial security solution.

According to Cilasoft President, Guy Marmorat, "The new software, when coupled with our existing QJRN/400 software will enable our customers to be in strict compliance with the PCI Data Security Standard in the area of monitoring access to sensitive data. This new capability will also be critical to our customers facing laws and regulations dealing with monitoring access to private health information and other protected personal and financial information."

Dan Riehl, the head of US Operations for Cilasoft said "I've been anxiously awaiting this announcement since I heard of the plans and design over a year ago. It's not a big technical challenge to build a tool to monitor Database "View Record" events on the i. But it is a HUGE challenge to build this tool in such an intelligent way that the performance metrics don't outweigh the great benefit of the tool. Guy and his development group at Cilasoft have tuned the performance of this software to the max. It is truly a revolutionary software tool that is long overdue in the System i arena."

The new software named "Database View Monitor for i" or "DVM", is part of the newly upgraded Cilasoft Security Suite 5.0. The suite also includes QJRN/400 and CONTROLER. The entire suite of Cilasoft security and auditing tools is compatible with the new IBM operating system release 7.1.

Cilasoft(www.Cilasoft.com), is a global leader in security and compliance solutions for IBM System i (AS/400). The company's flagship products, QJRN/400 and CONTROLER, were originally developed in response to policies and procedures dictated by the International Monetary Fund. After more than a decade, these products have evolved into a sophisticated suite of tools that carry the "IBM Server Proven" mark of excellence. Cilasoft is an Advanced IBM Business Partner with headquarters in the Alpine region of France. The company has a vast network of international sales partners and has customers in over 45 countries.
